Note: Sold in collaboration with Novozymes A/S for research purposes only.

Lipozyme® TL 100 L is a 1,3 specific lipase originating from *Thermomyces lanuginosus*. It is a very effective catalyst for transesterification, interesterification, ester hydrolysis and desymmetrisation of esters. Lipozyme® TL 100 L exhibits a high degree of substrate selectivity allowing bulky side chains/large groups on the alcohol and acid parts of the molecule.

One use of Lipozyme® TL 100 L is in the commercial manufacture of Pregabalin. The key synthetic step is the enzymatic resolution of a racemic cyano diethylester (CNDE) to produce the desired monoacid enantiomer. In this application, Lipozyme® TL 100 L performs well in activity and enantioselectivity.

Kinetic resolution by desymmetrisation of the cyano diethylester intermediate for Pregabalin.

Declared activity 100 KLU/g. Lipase that hydrolyzes ester bonds in glycerides. Color can vary from batch to batch. Color intensity is not an indication of enzyme activity. Packaging must be kept intact, dry and away from sunlight. Please follow the recommendations and use the product before the best before date to avoid the need for a higher dosage.

**Other Lipase products offered by Strem:**

- 06-3118 Palatase® 20000 L
- 06-3155 Lipozyme® TL IM
- 06-3100 Novocor® AD L
- 06-3120 Lipozyme® RM
- 06-3105 Lipozyme® CALB L
- 06-3135 Novozym® 51032
- 06-3123 Novozym® 435
- 06-3125 Resinase® HT
- 96-0220 Novozymes Lipase Screening Kit (contains 9 lipase enzymes)

**Endoprotease products offered by Strem:**

- 06-3110 Alcalase® 2.4 L FG
- 06-3112 Alcalase® 2.5 L
- 06-3137 Savinase® 12 T
- 06-3150 Savinase® 16 L
- 06-3115 Esperase® 8.0 L
- 06-3160 Neutrase® 0.8 L
- 96-0224 Novozymes Endoprotease Screening Kit (contains 6 endoprotease enzymes)

**Novozymes Lipase Products**

**Storage**

Kits should be optimally stored at 0-10°C/32-50°F. If stored above 25°C/77°F the samples should be used within 3 months.

**Introduction**

Lipases (EC Number 3.1.1.3) are one of the most commonly used classes of enzymes in biocatalysis. They have been used on a variety of substrates and show very broad substrate
specificity. Lipases catalyze the hydrolysis of triacylglycerols to diacylglycerol, monoacylglycerol, glycerol and free fatty acids. The reaction reverses under anhydrous conditions and the enzyme is able to synthesize new molecules by esterification, alcoholysis and transesterification. All reactions can be performed with high regio- and enantioselectivity under mild reaction conditions.

![Figure 1: Regioselective hydrolysis of a triacylglycerol.](image)

* K = Kilo, LU = Lipase unit, PLU = Propyl Laurate Unit, IUN = Interesterification Unit.

1LU is the amount of enzyme activity which liberates 1 µmol of tritratable butyric acid from the substrate glycerol tributyrate per minute under defined standard conditions. 1LU is equal to 1IUN. 1 PLU is the amount of enzyme activity which generates 1 µmol of propyl laurate per minute under defined standard conditions.
Kinetic Resolution

Example 1. Kinetic resolution by transesterification of racemic alcohol

- Racemic alcohol (1-2 mmol) is solubilized in organic solvent (10 mL Toluene (dry) or other solvent)*
- Acyl donor vinyl acetate (1:3 or 1:5 molar ratio compared to racemic alcohol) is added.
- Immobilized Lipase Enzyme 1-3 (50% wt/wt with regards to substrate) is added and the reaction is conducted under stirring.
- Typical reaction temperature is 25-50°C and typical reaction time is 36-72 hours, depending on substrate.
- The reaction product is recovered by removing the immobilized enzyme by filtration.

* Alternative solvents: methyl tert butyl ether (MTBE), n-hexane, iso-octane.

Example 2. Kinetic resolution of racemic alcohol by hydrolysis of acetoxy derivative

- Racemic acetoxy ester (1-2 mmol) is solubilized/dispersed in potassium phosphate buffer (0.1 M, pH 7.5, 10 mL). For liquid substrates, emulsion or suspension will be formed. For solid substrates, solution is prepared by adding 10% v/v of organic solvent*
- Lipase Enzyme 1-9 is added to the substrate solution (50% wt/wt for solid enzyme or 10-20% v/v with regards to buffer for liquid enzyme)
- Reaction mixture pH is maintained at 7.5 by adjusting with 1N NaOH.
- Typical reaction temperature is 25-40°C and typical reaction time is 24-48 hours.
- The reaction product is recovered by extraction or filtration.
Solvent examples: IPA, acetone, tert-butanol, THF or acetonitrile

**Example 3. Dynamic kinetic resolution of racemic alcohols**

Racemic Alcohol

- Ruthenium catalyst* (0.05 eq with regards to substrate), Immobilized lipase 1-3 (50% w/w with regards to substrate) and Na₂CO₃ (1.0 eq. with regards to substrate) are dissolved in dry organic solvent (5 mL Toluene**) under inert atmosphere (N₂) in a closed vessel.
- Dry toluene is added and resulting mixture is stirred.
- A THF solution of t-BuOK (0.05 eq with regards to substrate) is added to reaction mixture.
- After 30 min. of stirring, racemic alcohol (1-2 mmol) dissolved in toluene (5 mL) is added at 25-30°C and stirring continued in 10 min.
- Vinyl acetate (3.0 eq with regards to substrate) is charged to reaction mixture at 25-30°C.
- Reaction temperature is 50-55°C and typical reaction time is 36 hours.
- Reaction product is recovered by filtration through filter aid and the filtrate is concentrated to obtain crude product.

*Ruthenium catalyst options: Chlorodicarbonyl (1,2,3,4,5-pentaphenylcyclopentadienyl) ruthenium (η⁵C₅H₅)Ru(CO)₂Cl or Shvo catalyst - 1-Hydroxytetraphenylcyclopentadienyl-(tetraphenyl-2,4-cyclopentadien-1-one)-μ-hydrotetracarbonyldiruthenium(II)

**Solvents have to be dried before using (moisture content should be < 0.01%)**

**Example 4. Kinetic Resolution by transesterification of Racemic Amine**

Racemic Alcohol

- Acyl donor* ethyl acetate (5 mL) is charged to vessel under inert atmosphere (N₂)
- Racemic amine (1-2 mmol) and Immobilized lipase 1-3 (50% wt/wt with regards to substrate) is added to ethyl acetate at 25-50°C under moderate stirring and inert atmosphere.
- Typical reaction temperature is 25-40°C and typical reaction time is 36-72 hours, depending on substrate.
• Reaction product is recovered by filtration, whereby immobilized enzyme is removed.

*Acyl donor solvent: α-methylbenzyl acetate, methylethoxy acetate, ethyl acetate and methyl tert butyl ether.

**Example 5.** Kinetic resolution by hydrolysis of racemic carboxylic ester

![Reaction Scheme](image)

- Racemic ester (1-2 mmol), organic solvent (5 mL MTBE or Toluene) and potassium phosphate buffer (0.1 M, pH 7.0, 5 mL) is homogenized by stirring. [Two layers will form once stirring is stopped; stir until substrate is soluble in organic phase. In case of immobilized enzymes, solid suspension is observed.]
- Lipase Enzyme (50% wt/wt with regards to substrate for solid enzyme 1-3 or 10-20% v/v with regards to solvent mixture for liquid enzyme 4-9) is added under stirring.
- Reaction mixture is maintained at pH 7.0 by adjusting with 1N NaOH.
- Typical reaction temperature is 20-35°C and typical reaction time is 24-48 hours, depending on substrate.
- Reaction product is recovered by extraction or filtration.

**Example 6.** Desymmetrisation of diesters

![Reaction Scheme](image)

- Racemic diester (1-2 mmol) and potassium phosphate buffer (0.1 M, pH 7.0, 10 mL) is homogenized by stirring.
  - For liquid substrates emulsion or suspension will be formed.
  - For solid substrates a solution is prepared by adding additional solvents such.
  - Biphasic reactions can be carried out by making solution in MTBE or toluene.
  - Solvent free reactions can be carried out in a solid suspension.
- Lipase Enzyme (50% wt/wt for solid enzyme 1-3 or 10-20% v/v with regards to buffer for liquid enzyme 4-9) is added and stirring continued.
- Reaction mixture is maintained at pH 7.5 by adjusting with 1N NaOH.
• Typical reaction temperature is 25-40°C and typical reaction time is 24-48 hours, depending on substrate.
• Reaction product is recovered by extraction or filtration.

*Solvent: acetone, tetrahydrofuran (THF) or acetonitrile.

**Analytical Method Principles**

In-process reaction monitoring:

Depending on substrate and product, different methods can be used for in process reaction monitoring.

- Thin Layer Chromatography (TLC) is a simple method for monitoring reaction progress and completion.
- To quantitatively estimate product formation and consumption of reactant, HPLC or GC can be used for monitoring.
- Chiral HPLC is recommended to estimate chiral purity or consumption of isomers of racemic mixture.
- Final chiral purity can be obtained by analyzing product isolated by using an appropriate chiral column.

Key parameters for Enantiomeric excess (ee) and Enantioselectivity (E) can be calculated from the areas in chiral HPLC:

\[
\% \text{ ee} = \left(\frac{R-S}{R+S}\right) \times 100 \\
\text{Where } R = \text{ area for R isomer and } S = \text{ area for S isomer}
\]

\[
E = \frac{\ln \left[ \frac{1 - e.e_s}{1 + e.e_s} \right]}{\ln \left[ \frac{1 - e.e_r}{1 + e.e_r} \right]}
\]

**Screening Procedure**

Listed below is recommended equipment for conducting the screens, however, pH-stat system gives more consistent results.
