Reactant-Free Gold Nanoparticles

The reactant-free colloidal gold nanoparticles offered in **Kit Cat No. 96-1545** are >99% free of residual reactants and offer high protein binding efficiencies. Supplied in 0.1 mM phosphate buffered saline (PBS) with an optical density (OD) = 1, they are designed for use in sensitive applications, such as conjugate development by passive adsorption of proteins and other ligands, cellular studies, immunostaining, immunochromatography, lateral flow assays, biological sensor development, electron microscopy, and Surfaced Enhanced Raman Spectroscopy (SERS).

Surfactant-Stabilized Gold Nanoparticles

The surfactant-stabilized colloidal gold nanoparticles offered in **Kit Cat No. 96-1547** are provided at an optical density (OD) = 1 in a solution that is stabilized with proprietary stabilizer that imparts increased overall stability, a higher salt tolerance (up to 2M NaCl) and improved temperature stability. They are ideally suited for binding with thiolated ligands such as oligonucleotides and polyethylene glycols for use in blotting and lateral flow assays, and also find use in physical and optical applications where harsher conditions are required. Note that these gold nanoparticles are not appropriate for protein adsorption.

Superior Size Distribution and Shape

The reactant-free and surfactant-stabilized gold nanoparticles offered as part of these kits are made using a proprietary production process that affords excellent control over the size distribution and shape of the nanoparticles. The narrow size distribution (CV of less than 15%) gives these gold nanoparticles enhanced stability.

In addition, the particles are greater than 95% spherical with an excellent aspect ratio (length/width) and a high level of monodispersity, which minimizes variation in product performance and provides greater control over the available surface area. Low batch-to-batch variability (+/- 2nm) also ensures consistent quality and higher performance.

Storage Instructions for Reactant-Free and Surfactant-Stabilized Gold Nanoparticles

Gold nanoparticles should be stored away from direct sunlight at 4-25°C, preferably at a lower temperature, which will prolong the shelf life. However, do NOT allow the nanoparticle solutions to freeze. Freezing causes irreversible aggregation. When stored as specified, the gold nanoparticle solutions are stable for at least six months.
